

PNK Suguan 2.1.0 — First-Run Administrator Guide

PNK Suguan 2.1.0 — release documentation (source: FIRST-RUN-ADMINISTRATOR-GUIDE.md)

On a genuine first run, the bundled PostgreSQL cluster is initialized in %LOCALAPPDATA%\PNK Suguan\, the application database is created, all migrations (0000–0013) are applied once, and the initial Administrator account is provisioned.

The generated one-time password is written to:

```
%LOCALAPPDATA%\PNK Suguan\FIRST-RUN-ADMIN-PASSWORD.txt
```

This document contains no password. Read the file locally, sign in, and complete the forced password rotation. Password changes revoke existing sessions. Delete the one-time password file immediately after successful rotation.

The first account is Administrator, not SUPER_ADMIN. SUPER_ADMIN remains an exceptional, separately controlled emergency capability. Never copy .env, credentials, password files, or session material into the program folder or distribution package.

What the first administrator should do

1. **Record each Guro's Duty** (Destinado / Katuwang) on the Teachers pages, and set each teacher's **Current Destination** with its Duty. Duty-based generation reads these and will never infer them. A dako may hold one Destinado and one Katuwang at the same time.
2. **Encode weekly availability** for the weeks it intends to generate — every master-ACTIVE teacher must have a record per week. The dashboard matrix's readiness marks show at a glance which weeks are ready.
3. **Configure email if password recovery is expected.** SMTP keys go in %LOCALAPPDATA%\PNK Suguan\.env (PNK_SMTP_HOST, PNK_SMTP_PORT, PNK_SMTP_SECURE, PNK_SMTP_USER, PNK_SMTP_PASS, PNK_SMTP_FROM, or the single PNK_SMTP_URL), then the application must be restarted. **Settings -> Email delivery** states whether email is configured and offers an audited test send to your own address; until it is configured, "Forgot password" accepts requests but cannot deliver a code.
4. **Review Settings**, including the backup location, so operator backups have somewhere to land. Settings also carries the **Administrator documentation** link to the Super Admin guide PDF shipped inside the package.
5. **Create the operator accounts** the site needs (Settings -> Users), assigning the least role that fits each person — see USER-ROLE-GUIDE.md. Teachers, Dako, Users, and Backup/Restore are all reached through the **Settings** group in the sidebar.

Nothing in this release requires an internet connection: the database, the application, the fonts, and the documentation PDFs are all bundled locally.
