

PNK Suguan 2.1.0 — User and Role Guide

PNK Suguan 2.1.0 — release documentation (source: USER-ROLE-GUIDE.md)

Authorization is enforced server-side. Navigation reflects permissions, but it is never the boundary: every page and API route checks the caller's permissions itself, and a route reached by direct URL is checked exactly as one reached from the menu.

- **Administrator (ADMIN)**: day-to-day user, teacher, dako, availability, schedule, report, and notification administration; can generate schedules by any method, finalize, publish, revise finalized schedules, create **and restore** backups, and read the audit log.
- **Scheduler/Encoder (SCHEDULER)**: encodes teachers, dako, availability, and assignments; can generate schedules by any method, encode finalized revisions, create backups, and generate report PDFs; cannot restore backups, finalize, publish, override assignments, manage users, read the audit log, or reach the backup/destinations configuration.
- **Viewer (VIEWER)**: read-only access to schedules, teachers, dako, history, reports (including PDF export); cannot create or modify records, encode availability, generate schedules, or restore anything.
- **SUPER_ADMIN (SUPER_ADMIN)**: exceptional emergency role for authorized published-schedule correction; not granted through the normal user form. See SUPER-ADMIN-GUIDE.md.

Where each page lives

Sidebar entry	Opens
Dashboard	Annual matrix, Generate Suguan
Schedule -> Weekly Schedule	The week's SUGO / RESERBA / RESERBA II cells and the Weekly Suguan PDF
Schedule -> Availability	Weekly availability encoding and the Fix availability flow
Schedule -> Magtuturo	Mga Magtuturo sa Klase (teaching assignments)
Schedule -> Historical Backfill	Pre-go-live assignment encoding
Reports	Every report, each with Generate PDF, including the Teacher Masterlist
Settings -> Teachers / Dako	Master data and destination history
Settings -> Users	Account and role administration (users.manage only)
Settings -> Backup/Restore	Backups, restore, email delivery state, administrator documentation
Audit	Administrative action history (ADMIN and SUPER_ADMIN only)

A role that lacks a permission does not receive the entry at all: Viewer sees no Users, no Backup/Restore, and no Audit. Group headers open by click, tap, or keyboard — never by hover alone.

Permissions at a glance

Capability	ADMIN	SCHEDULER	VIEWER	SUPER_ADMIN
Read schedules, teachers, dako, history, reports	yes	yes	yes	yes
Encode teachers / dako / availability / assignments	yes	yes	no	yes
Generate schedules (any method)	yes	yes	no	yes
Finalize / publish a week	yes	no	no	yes
Revise a FINALIZED week	yes	yes	no	yes

Override an overridable assignment rule	yes	no	no	yes
Create a backup	yes	yes	no	yes
Restore a backup	yes	no	no	yes
Read the audit log	yes	no	no	yes
Manage users	yes	no	no	yes
Correct a PUBLISHED week	no	no	no	yes

Not overridable by anyone

LANGUAGE_MISMATCH (a Filipino teacher on an English dako) and DAKO_DISABLED cannot be cleared by an override reason, by any role, including SUPER_ADMIN. The only remedy for the first is correcting the teacher's recorded language, if that is genuinely true of them.

New in 2.1.0

- **Destination Duty is part of the relationship.** Setting a teacher's Current Destination requires choosing a Duty (Destinado / Katuwang); the duty is stored with the period and audited on both sides of the change. Teacher records still carry `duty` as the current-period mirror that duty-based generation reads.
- **Every report exports to PDF** under the same permission as viewing it (`reports.read`), always with the filters currently applied on the page. A PDF export is read-only: it changes no data and writes no audit rows.
- **Email delivery state and test send require `users.manage`.** A Viewer cannot read the configuration state or trigger a test.
- **The delivery test can only send to the signed-in administrator's own address** — never to an arbitrary recipient — and every attempt is audited (`EMAIL_TEST_SENT`).
